Class Diagram.pdf

High level testing initially done on Eclipse with a server running Linux and the client on Windows communicating with an IP address. Printing to console was used for most debugging purposes. After program was refined and features added, JAR files were created and file paths were altered to match JAR file structure. File dumps and threads were used to improve function control. All features were tested and debugged. Some of which include group chats, individual chats, log in information, exit chat, quit client, friend lists, and friend requests.
